Register Mapping

The Register Mapping section discusses the registers of the PSoC 4 device. It lists all the registers in mapping tables, in address order.

Register General Conventions

The register conventions specific to this section and the Register Reference chapter are listed in this table.

Convention	Example	Description
'x' in a register name	ACBxxCR1	Multiple instances/address ranges of the same register
R	R : 00	Read register or bit(s)
W	W : 00	Write register or bit(s)
WOC	WOC:0	Write one to clear
WZC	WZC:0	Write zero to clear
RC	RC:0	Read to clear
WC	WC:0	Write to clear
NA	NA:000	Reserved
U	R:U	Undefined
00	RW : 00	Reset value is 0x00
XX	RW : XX	Register is not reset
Empty, grayed out table cell		Reserved bit or group of bits, unless otherwise stated. Write reserved bits to zero. Software cannot make any assumptions about return values.

1   CM0 Registers

This section discusses the CM0 registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

1.1   CM0 Register Details

Register	Address	Description
CM0_DWT_PID4	0xE0001FD0	Watchpoint Unit CoreSight ROM Table Peripheral ID #4
CM0_DWT_PID0	0xE0001FE0	Watchpoint Unit CoreSight ROM Table Peripheral ID #0
CM0_DWT_PID1	0xE0001FE4	Watchpoint Unit CoreSight ROM Table Peripheral ID #1
CM0_DWT_PID2	0xE0001FE8	Watchpoint Unit CoreSight ROM Table Peripheral ID #2
CM0_DWT_PID3	0xE0001FEC	Watchpoint Unit CoreSight ROM Table Peripheral ID #3
CM0_DWT_CID0	0xE0001FF0	Watchpoint Unit CoreSight ROM Table Component ID #0
CM0_DWT_CID1	0xE0001FF4	Watchpoint Unit CoreSight ROM Table Component ID #1

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
16	COUNTFLAG	Indicates whether the counter has counted to "0" since the last read of this register: '0': counter has not counted to "0". '1': counter has counted to "0". COUNTFLAG is set to '1' by a count transition from "1" to "0". COUNTFLAG is cleared to '0' by a read of this register, and by any write to the SYST_CVR register. Default Value: 0

1.1.19   CM0_SYST_CSR (continued)

2	CLKSOURCE	Indicates the SysTick counter clock source: '0': SysTick uses the low frequency clock "clk_lf". For this mode to function, "clk_lf" should be less than half the frequency of "clk_sys". Note that "clk_lf" is generated by a low accuracy ILO (Internal Low power Oscillator), with a target frequency of 32.768 kHz (frequency can be as low as 15 KHz and as high as 60 kHz). '1': SysTick uses the system/processor clock "clk_sys". In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided. in SF, TSG6M products, this functionality is not provided. For these products, this field should be set to '1', such that SysTick uses the system clock "clk_sys". Default Value: 0
1	TICKINT	Indicates whether counting to "0" causes the status of the SysTick exception to change to pending: '0': count to "0" does not affect the SysTick exception status. '1': count to "0" changes the SysTick exception status to pending. Changing the value of the counter to "0" by writing zero to the SYST_CVR register to "0" never changes the status of the SysTick exception. Default Value: 0
0	ENABLE	Indicates the enabled status of the SysTick counter: '0': counter is disabled. '1': counter is operating. Default Value: 0

Name	NOREF	SKEW	None [29:24]					

Bits	Name	Description
31	NOREF	Indicates whether a implementation defined reference clock is provided: '0': the reference clock is provided. '1': the reference clock is not provided. When this bit is '1', the SYST_CSR.CLKSOURCEis forced to '1' and cannot be cleared to '0'. In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '0'. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '1'. Default Value: 0
30	SKEW	Indicates whether the 10ms calibration value is exact: '0': 10ms calibration value is exact. '1': 10ms calibration value is inexact, because of the clock frequency. In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is '1' (due to the low accuracy ILO). In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is '0'. Default Value: X

1.1.22 CM0_SYST_CALIB (continued)

23 : 0	TENMS	Optionally, holds a reload value to be used for 10ms (100Hz) timing, subject to system clock skew errors. If this field is "0", the calibration value is not known.

In PSoC4A-BLE (and later products), SysTick counter functionality on the low frequency clock is provided and this field is 0x00:00147. In earlier products, SysTick counter functionality on the low frequency clock is NOT provided and this field is 0x00:0000.
Default Value: X

Bits	Name	Description
31	NMIPENDSET	Activates an NMI exception or reads back the current state. Because NMI is the highest priority exception, it activates as soon as it is registered. Default Value: 0
28	PENDSVSET	Sets a pending PendSV interrupt or reads back the current state. Use this normally to request a context switch. Writing PENDSVSET and PENDSVCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0
27	PENDSVCLR	Clears a pending PendSV interrupt. Default Value: 0
26	PENDSTSETb	Sets a pending SysTick or reads back the current state. Writing PENDSTSET and PENDSTCLR to '1' concurrently is UNPREDICTABLE. Default Value: 0
25	PENDSTCLR	Clears a pending SysTick, whether set here or by the timer hardware. Default Value: 0

1.1.29 **CM0_ICSR** (continued)

23	ISRPREEMPT	Indicates whether a pending exception will be serviced on exit from debug halt state. Default Value: 0
22	ISRPENDING	Indicates if an external configurable, NVIC generated, interrupt is pending. Default Value: 0
20 : 12	VECTPENDING	The exception number for the highest priority pending exception. 0= No pending exceptions. The pending state includes the effect of memory-mapped enable and mask registers. It does not include the PRIMASK special-purpose register qualifier. Default Value: 0
8 : 0	VECTACTIVE	The exception number for the current executing exception. 0= Thread mode. This is the same value as IPSR[8:0] Default Value: 0

Bits	Name	Description
31 : 16	VECTKEY	Vector Key. The value 0x05FA must be written to this register, otherwise the register write is UN-PREDICTABLE. Readback value is UNKNOWN. Default Value: X
15	ENDIANNESS	Indicates the memory system data endianness: 0 little endian 1 big endian. See Endian support on page A3-44 for more information. Default Value: 0
2	SYSRESETREQ	System Reset Request. Writing 1 to this bit asserts a signal to request a reset by the external system. This will cause a full system reset of the CPU and all other components in the device. See Reset management on page B1-240 for more information. Default Value: 0
1	VECTCLRACTIVE	Clears all active state information for fixed and configurable exceptions. The effect of writing a 1 to this bit if the processor is not halted in Debug state is UN-PREDICTABLE. Default Value: 0

2 CPUSS Registers

This section discusses the CPUSS registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

2.1 CPUSS Register Mapping Details

Register	Address	Description
CPUSS_CONFIG	0x40100000	Configuration register
CPUSS_SYSREQ	0x40100004	SYSCALL control register
CPUSS_SYSARG	0x40100008	SYSARG control register
CPUSS_PROTECTION	0x4010000C	Protection control register
CPUSS_PRIV_ROM	0x40100010	ROM privilege register
CPUSS_PRIV_RAM	0x40100014	RAM privilege register
CPUSS_PRIV_FLASH	0x40100018	ROM privilege register
CPUSS_WOUNDING	0x4010001C	Wounding register
CPUSS_FLASH_CTL	0x40100030	FLASH control register
CPUSS_ROM_CTL	0x40100034	ROM control register

HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	VECT_IN_RAM	0': Vector Table is located at 0x0000:0000 in flash '1': Vector Table is located at 0x2000:0000 in SRAM Note that vectors for RESET and FAULT are always fetched from ROM. Value in flash/RAM is ignored for these vectors. Default Value: 0

2.1.2   CPUSS_SYSREQ

SYSCALL control register

Address: 0x40100004

Retention: Retained

Bits	7	6	5	4	3	2	1	0

Name	SYSCALL_COMMAND [15:8]							

Bits	23	22	21	20	19	18	17	16
SW Access	None							
HW Access	None							
Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	RW	R	R	RW	RW	None		
HW Access	R	W	RW	A	R	None		
Name	SY-SCALL_REQ	HMAS-TER_0	ROM_AC-CESS_EN	PRIVI-LEGED	DIS_RE-SET_VECT_REL	None [26:24]		

Bits	Name	Description
31	SYSCALL_REQ	CPU/DAP writes a '1' to this field to request a SystemCall. The HMASTER_0 field indicates the source of the write access. Setting this field to '1' immediate results in a NMI. The SystemCall NMI interrupt handler sets this field to '0' after servicing the request. Default Value: 0
30	HMASTER_0	Indicates the source of the write access to the SYSREQ register. '0': CPU write access. '1': DAP write access. HW sets this field when the SYSREQ register is written to and SYSCALL_REQ is '0' (the last time it is set is when SW sets SYSCALL_REQ from '0' to '1'). Default Value: 0
29	ROM_ACCESS_EN	Indicates that executing from Boot ROM is enabled. HW sets this field to '1', on reset or when the SystemCall NMI vector is fetched from Boot ROM. HW sets this field to '0', when the CPU is NOT executing from either Boot or System ROM. This bit is used for debug purposes only. Default Value: 1

2.1.2   CPUSS_SYSREQ (continued)

28	PRIVILEGED	Indicates whether the system is in privileged ('1') or user mode ('0'). Only CPU SW executing from ROM can set this field to '1' when ROM_ACCESS_EN is '1' (the CPU is executing a SystemCall NMI interrupt handler). Any other write to this field sets is to '0'. This field is used as the AHB-Lite hprot[1] signal to implement Cypress proprietary user/privileged modes. These modes are used to enable/disable access to specific MMIO registers and memory regions. Default Value: 1
27	DIS_RESET_VECT_REL	Disable Reset Vector fetch relocation: '0': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are redirected to ROM. '1': CPU accesses to locations 0x0000:0000 - 0x0000:0007 are made to flash. Note that this field defaults to '0' on reset, ensuring actual reset vector fetches are always made to ROM. Note that this field does not affect DAP accesses. Flash DfT routines may set this bit to '1' to enable uninhibited read-back of programmed data in the first flash page. Default Value: 0
15 : 0	SYSCALL_COMMAND	Opcode of the system call being requested. Default Value: 0

2.1.3   CPUSS_SYSARG

SYSARG control register

Address: 0x40100008

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access								
Name	SYSCALL_ARG [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	RW							
HW Access								
Name	SYSCALL_ARG [31:24]							

Bits	Name	Description
31 : 0	SYSCALL_ARG	Argument to System Call specified in SYSREQ. Semantics of argument depends on system call made. Typically a pointer to a parameter block. Default Value: 0

2.1.4 CPUSS_PROTECTION

Protection control register

Address: 0x4010000C

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	None				RW			
HW Access	None				A			
Name	None [7:4]				PROTECTION_MODE [3:0]

SW Access	RW1S	None						
HW Access	R	None						
Name	PROTEC-TION_LOCK	None [30:24]						

Bits	Name	Description
31	PROTECTION_LOCK	Setting this field will block (ignore) any further writes to the PROTECTION_MODE field in this register. Once '1', this field cannot be cleared. Default Value: 0
3 : 0	PROTECTION_MODE	Current protection mode; this field is available as a global signal everywhere in the system. Writes to this field are ignored when PROTECTION_LOCK is '1': 0b1xxx: BOOT 0b01xx: KILL 0b001x: PROTECTED 0b0001: OPEN 0b0000: VIRGIN (also used for DEAD mode, but then FLASH_LOCK is also set) Default Value: 15

2.1.5 CPUSS_PRIV_ROM

ROM privilege register

Address: 0x40100010

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	BROM_PROT_LIMIT [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
7 : 0	BROM_PROT_LIMIT	Indicates the limit where the privileged area of the Boot ROM partition starts in increments of 256 Bytes. "0": Entire Boot ROM is Privileged. "1": First 256 Bytes are User accessable. ... BROM_PROT_LIMIT >= "Boot ROM partition capacity": Entire Boot ROM partition is user mode accessible. Default Value: 0

2.1.6   CPUSS_PRIV_RAM

RAM privilege register

Address: 0x40100014

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	RAM_PROT_LIMIT [7:0]

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
8 : 0	RAM_PROT_LIMIT	Indicates the limit where the privileged area of SRAM starts in increments of 256 Bytes. "0": Entire SRAM is Privileged. "1": First 256 Bytes are User accessable. Any number larger than the size of the SRAM indicates that the entire SRAM is user mode accessible. Default Value: 0

2.1.7   CPUSS_PRIV_FLASH

ROM privilege register

Address: 0x40100018

Retention: Retained

Bits	7	6	5	4	3	2	1	0
SW Access	RW							
HW Access	R							
Name	FLASH_PROT_LIMIT [7:0]							

Bits	15	14	13	12	11	10	9	8

Name	None [23:16]							

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
10 : 0	FLASH_PROT_LIMIT	Indicates the limit where the privileged area of flash starts in increments of 256 Bytes. "0": Entire flash is Privileged. "1": First 256 Bytes are User accessable. Any number larger than the size of the flash indicates that the entire flash is user mode accessible. Note that SuperVisory rows are always User accessable. If FLASH_PROT_LIMIT defines a non-empty privileged area, the boot ROM will assume that a system call table exists at the beginning of the Flash privileged area and use it for all SystemCalls made using SYSREQ. Default Value: 0

2.1.8   CPUSS_WOUNDING

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
22 : 20	FLASH_WOUND	Indicates the amount of accessible flash in this part. The value in this field is effectively write-once (it is only possible to set bits, not clear them). The remainder portion of flash is not accessible and will return an AHB-Lite bus error. "0": entire memory accessible "1": first 1/2 of the memory accessible "2": first 1/4 of the memory accessible "3": first 1/8 of the memory accessible "4": first 1/16 of the memory accessible "5": first 1/32 of the memory accessible "6": first 1/64 of the memory accessible "7": first 1/128 of the memory accessible (used for the DEAD protection mode) Default Value: 0

2.1.8   **CPUSS_WOUNDING** (continued)

18 : 16	RAM_WOUND	Indicates the amount of accessible RAM 0 memory capacitty in this part. The value in this field is effectively write-once (it is only possible to set bits, not clear them). The remainder portion of SRAM is not accessible and will return an AHB-Lite bus error.

"0": entire memory accessible
"1": first 1/2 of the memory accessible

Bits	Name	Description
0	ROM_WS	Amount of ROM wait states: '0': 0 wait states. Use this setting for newer, faster ROM design. Use this setting for older, slower ROM design and frequencies in the range [0, 24] MHz. '1': 1 wait state. Use this setting for older, slower ROM design and frequencies in the range <24, 48] MHz. CPUSSv2 supports two types of ROM memory: an older, slower design (operating at up to 24 MHz) and a newer, faster design (operating at up to 48 MHz). The older design requires 1 wait state for frequencies above 24 MHz. The newer design never requires wait states. All chips after Street Fighter will use the newer design. As a result, all chips after Street Fighter can always use 0 wait states. Default Value: 0

3   GPIO Registers

This section discusses the GPIO registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

3.1   GPIO Register Mapping Details

Register	Address	Description
GPIO_PRT0_DR	0x40040000	Port output data register
GPIO_PRT0_PS	0x40040004	Port IO pad state register
GPIO_PRT0_PC	0x40040008	Port configuration register
GPIO_PRT0_INTR_CFG	0x4004000C	Port interrupt configuration register
GPIO_PRT0_INTR	0x40040010	Port interrupt status register
GPIO_PRT0_PC2	0x40040018	Port configuration register 2
GPIO_PRT0_DR_SET	0x40040040	Port output data set register
GPIO_PRT0_DR_CLR	0x40040044	Port output data clear register
GPIO_PRT0_DR_INV	0x40040048	Port output data invert register
GPIO_PRT1_DR	0x40040100	Port output data register. See GPIO_PRT0_DR for the details of bit fields.
GPIO_PRT1_PS	0x40040104	Port IO pad state register. See GPIO_PRT0_PS for the details of bit fields.
GPIO_PRT1_PC	0x40040108	Port configuration register. See GPIO_PRT0_PC for the details of bit fields.
GPIO_PRT1_INTR_CFG	0x4004010C	Port interrupt configuration register. See GPIO_PRT0_INTR_CFG for the details of bit fields.
GPIO_PRT1_INTR	0x40040110	Port interrupt status register. See GPIO_PRT0_INTR for the details of bit fields.
GPIO_PRT1_PC2	0x40040118	Port configuration register 2. See GPIO_PRT0_PC2 for the details of bit fields.
GPIO_PRT1_DR_SET	0x40040140	Port output data set register. See GPIO_PRT0_DR_SET for the details of bit fields.
GPIO_PRT1_DR_CLR	0x40040144	Port output data clear register. See GPIO_PRT0_DR_CLR for the details of bit fields.
GPIO_PRT1_DR_INV	0x40040148	Port output data invert register. See GPIO_PRT0_DR_INV for the details of bit fields.
GPIO_PRT2_DR	0x40040200	Port output data register
GPIO_PRT2_PS	0x40040204	Port IO pad state register
GPIO_PRT2_PC	0x40040208	Port configuration register
GPIO_PRT2_INTR_CFG	0x4004020C	Port interrupt configuration register
GPIO_PRT2_INTR	0x40040210	Port interrupt status register
GPIO_PRT2_PC2	0x40040218	Port configuration register 2
GPIO_PRT0_DR_SET	0x40040240	Port output data set register. See GPIO_PRT0_DR_SET for the details of bit fields.
GPIO_PRT0_DR_CLR	0x40040244	Port output data clear register. See GPIO_PRT0_DR_CLR for the details of bit fields.
GPIO_PRT0_DR_INV	0x40040248	Port output data invert register. See GPIO_PRT0_DR_INV for the details of bit fields.

Bits	Name	Description
3 : 0	PORT_INT	Each IO port has an associated bit field in this register. The bit field reflects the IO port's interrupt line (bit field i reflects "gpio_interrupts[i]" for IO port i). The register is used when the system uses a shared/combined interrupt line "gpio_interrupt". The SW ISR reads the register to deternine which IO port(s) is responsible for the shared/combined interrupt line "gpio_interrupt". Once, the IO port(s) is determined, the IO port's INTR register is read to determine the IO pad(s) in the IO port that caused the interrupt. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	RW	RW	None					
HW Access	RW1C	RW1C	None					
Name	ENABLE	DISABLE	None [29:24]					

Bits	Name	Description
31	ENABLE	Clock divider enable command (mutually exclusive with DISABLE). Typically, SW sets this field to '1' to enable a divider and HW sets this field to '0' to indicate that divider enabling has completed. When a divider is enabled, its integer and fractional (if present) counters are initialized to "0". If a divider is to be re-enabled using different integer and fractional divider values, the SW should follow these steps: 0: Disable the divider using the DIV_CMD.DISABLE field. 1: Configure the divider's DIV_XXX_CTL register. 2: Enable the divider using the DIV_CMD_ENABLE field. The SEL_DIV and SEL_TYPE fields specify which divider is to be enabled. The enabled divider may be phase aligned to either "clk_hf" (typical usage) or to ANY enabled divider. The PA_SEL_DIV and P_SEL_TYPE fields specify the reference divider. The HW sets the ENABLE field to '0' when the enabling is performed and the HW set the DIV_XXX_CTL.EN field of the divider to '1' when the enabling is performed. Note that enabling with phase alignment to a low frequency divider takes time. E.g. To align to a divider that generates a clock of "clk_hf"/n (with n being the integer divider value INT_DIV+1), up to n cycles may be required to perform alignment. Phase alignment to "clk_hf" takes affect immediately. SW can set this field to '0' during phase alignment to abort the enabling process. Default Value: 0

5.1.1   PERI_DIV_CMD (continued)

| 30 | DISABLE | Clock divider disable command (mutually exlusive with ENABLE). SW sets this field to '1' and HW sets this field to '0'.

The SEL_DIV and SEL_TYPE fields specify which divider is to be disabled.

The HW sets the DISABLE field to '0' immediately and the HW sets the DIV_XXX_CTL.EN field of the divider to '0' immediately.
Default Value: 0 |
|---|---|---|
| 15 : 14 | PA_SEL_TYPE | Specifies the divider type of the divider to which phase alignment is performed for the clock en-able command:
0: 8.0 (integer) clock dividers.
1: 16.0 (integer) clock dividers.
2: 16.5 (fractional) clock dividers.
3: 24.5 (fractional) clock dividers.
Default Value: 3 |
| 13 : 8 | PA_SEL_DIV | (PA_SEL_TYPE, PA_SEL_DIV) pecifies the divider to which phase alignment is performed for the clock enable command. Any enabled divider can be used as reference. This allows all divid-ers to be aligned with each other, even when they are enabled at different times.

If PA_SEL_DIV is "63" and "PA_SEL_TYPE" is "3", "clk_hf" is used as reference.
Default Value: 63 |
| 7 : 6 | SEL_TYPE | Specifies the divider type of the divider on which the command is performed:
0: 8.0 (integer) clock dividers.
1: 16.0 (integer) clock dividers.
2: 16.5 (fractional) clock dividers.
3: 24.5 (fractional) clock dividers.
Default Value: 3 |
| 5 : 0 | SEL_DIV | (SEL_TYPE, SEL_DIV) specifies the divider on which the command (DISABLE/ENABLE) is per-formed.

If SEL_DIV is "63" and "SEL_TYPE" is "3" (default/reset value), no divider is specified and no clock signal(s) are generated.
Default Value: 63 |

7 : 6	SEL_TYPE	Specifies divider type: 0: 8.0 (integer) clock dividers. 1: 16.0 (integer) clock dividers. 2: 16.5 (fractional) clock dividers. 3: 24.5 (fractional) clock dividers. Default Value: 3
1 : 0	SEL_DIV	Specifies one of the dividers of the divider type specified by SEL_TYPE. If SEL_DIV is "63" and "SEL_TYPE" is "3" (default/reset value), no divider is specified and no clock control signal(s) are generated. When transitioning a clock between two out of phase dividers, spurious clock control signals may be generated for one clk_hf cycle during this transition. These clock control signals may cause a single clock period that is smaller than any of the two divider periods. To prevent these spurious clock signals, the clock multiplexer can be disconnected (SEL_DIV is "63" and "SEL_TYPE" is "3") for a transition time that is larger than the smaller of the two divider periods. Default Value: 3

Bits	Name	Description
23 : 8	INT16_DIV	Integer division by (1+INT16_DIV). Allows for integer divisions in the range [1, 65,536]. Note: this type of divider does NOT allow for a fractional division. For the generation of a divided clock, the integer division range is restricted to [2, 65,536]. For the generation of a 50/50% duty cycle digital divided clock, the integer division range is restricted to even numbers in the range [2, 65,536]. The generation of a 50/50 % duty cycle analog divided clock has no restrictions. Note that this field is retained. However, the counter that is used to implement the division is not and will be initialized by HW to "0" when transitioning from DeepSleep to Active power mode. Default Value: 0
0	EN	Divider enabled. HW sets this field to '1' as a result of an ENABLE command. HW sets this field to '0' as a result on a DISABLE command. Note that this field is retained. As a result, the divider does NOT have to be re-enabled after transitioning from DeepSleep to Active power mode. Default Value: 0

SW Access	RW	None					RW	
HW Access	R	None					R	
Name	ENABLED	None [30:26]					MODE [25:24]	

Bits	Name	Description
31	ENABLED	IP enabled ('1') or not ('0'). The proper order in which to initialize the IP is as follows: - Program protocol specific information using SPI_CTRL, UART_CTRL (and UART_TX_CTRL and UART_RX_CTRL) or I2C_CTRL. This includes selection of a submode, master/slave functionality and transmitter/receiver functionality when applicable. - Program generic transmitter (TX_CTRL) and receiver (RX_CTRL) information. This includes enabling of the transmitter and receiver functionality. - Program transmitter FIFO (TX_FIFO_CTRL) and receiver FIFO (RX_FIFO_CTRL) information. - Program CTRL to enable IP, select the specific operation mode and oversampling factor. When the IP is enabled, no control information should be changed. Changes should be made AFTER disabling the IP, e.g. to modify the operation mode (from I2C to SPI) or to go from externally to internally clocked. The change takes effect after the IP is re-enabled. Note that disabling the IP will cause re-initialization of the design and associated state is lost (e.g. FIFO content). Default Value: 0
25 : 24	MODE	Mode of operation (3: Reserved) Default Value: 3

6.1.1   SCB_CTRL (continued)

0x0: I2C :

Inter-Integrated Circuits (I2C) mode.

0x1: SPI :

Serial Peripheral Interface (SPI) mode.

0x2: UART :

Universal Asynchronous Receiver/Transmitter (UART) mode.

17	BLOCK	Only used in externally clocked mode. If the externally clocked logic and the MMIO SW accesses to EZ memory coincide/collide, this bit determines whether a SW access should block and result in bus wait states ('BLOCK is 1') or not (BLOCK is '0'). IF BLOCK is 0 and the accesses collide, MMIO read operations return 0xffff:ffff and MMIO write operations are ignored. Colliding accesses are registered as interrupt causes: field BLOCKED of MMIO registers INTR_TX and IN-TR_RX. Default Value: 0
16	ADDR_ACCEPT	Determines whether a received matching address is accepted in the RX FIFO ('1') or not ('0'). In I2C mode, this field is used to allow the slave to put the received slave address or general call address in the RX FIFO. Note that a received matching address is put in the RX FIFO when AD-DR_ACCEPT is '1' for both I2C read and write transfers. In multi-processor UART receiver mode, this field is used to allow the receiver to put the received address in the RX FIFO. Note: non-matching addresses are never put in the RX FIFO. Default Value: 0
11	BYTE_MODE	Determines the number of bits per FIFO data element: '0': 16-bit FIFO data elements. '1': 8-bit FIFO data elements. This mode doubles the amount of FIFO entries, but TX_C-TRL.DATA_WIDTH and RX_CTRL.DATA_WIDTH are restricted to [0, 7]. Default Value: 0
10	EZ_MODE	Non EZ mode ('0') or EZ mode ('1'). In EZ mode, a meta protocol is applied to the serial interface protocol. This meta protocol adds meaning to the data frames transferred by the serial interface protocol: a data frame can represent a memory address, a write memory data element or a read memory data element. EZ mode is only used for synchronous serial interface protocols: SPI and I2C. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported and the transmitter should use continuous data frames; i.e. data frames mot seperated by slave deselection. This mode is only applicable to slave functionality. In EZ mode, the slave can read from and write to an addressable memory structure of 32 bytes. In EZ mode, data frames should 8-bit in size and should be transmitted and received with the Most Significant Bit (MSB) first. In UART mode this field should be '0'. Default Value: 0

6.1.1 SCB_CTRL (continued)

9	EC_OP_MODE	Internally clocked mode ('0') or externally clocked mode ('1') operation. In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked operation mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode AND EZ mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported. The maximum SPI slave, EZ mode bitrate is 48 Mbps (transmission and IO delays outside the IP will degrade the effective bitrate).
		In UART mode this field should be '0'. Default Value: 0
8	EC_AM_MODE	Internally clocked mode ('0') or externally clocked mode ('1') address matching (I2C) or selection (SPI). In internally clocked mode, the serial interface protocols run off the peripheral clock. In externally clocked mode, the serial interface protocols run off the clock as provided by the serial interface. Externally clocked mode is only used for synchronous serial interface protocols (SPI and I2C) in slave mode. In SPI mode, only Motorola submode (all Motorola modes: 0, 1, 2, 3) is supported.
		In UART mode this field should be '0'. Default Value: 0

6.1.1 SCB_CTRL (continued)

3 : 0	OVS	Serial interface bit period oversampling factor expressed in IP clock cycles. Used for SPI and UART functionality. OVS + 1 IP clock cycles constitute a single serial interface clock/bit cycle. The IP clock is provided by the programmable clock IP. This field is NOT used in externally clocked mode. If OVS is odd, the oversampling factor is even and the first and second phase of the interface clock period are the same. If OVS is even, the oversampling factor is odd and the first phase of the interface clock period is 1 peripheral clock cycle longer than the second phase of the interface clock period.

In SPI master mode, the valid range is [3, 15]. At an IP frequency of 48 MHz, the maximum IP bit rate is 12 Mbps. The effective system bit rate is dependent on the external SPI slave that we communicate with. If the SPI output clock "spi_clk_out" to SPI MISO input "spi_miso_in" round trip delay is introducing significant delays (multiple "spi_clk_out" cycles), it may be necessary to increase OVS and/or to set SPI_CTRL.LATE_MISO_SAMPLE to '1' to achieve the maximum possible system bit rate. The maximum IP bit rate of 12 Mbps provides an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In SPI slave mode, the OVS field is NOT used. However, there is a frequency requirement for the IP clock wrt. the interface (IF) clock to guarantee functional correct behavior. This requirement is expressed as a ratio: IP clock/IF clock. The ratio is dependent on the setting of RX_CTRL.MEDIAN and the external SPI master's capability to support "late MISO sample" functionality (similar to our SPI master functionality represented by SPI_CTRL.LATE_MISO_SAMPLE):
- MEDIAN is '0' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 6. At a IP frequency of 48 MHz, the maximum bit rate is 8 Mbps.
- MEDIAN is '0' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 3. At a IP frequency of 48 MHz, the maximum bit rate is 16 Mbps.
- MEDIAN is '1' and external SPI master has NO "late MISO sample functionality": IP clock/IF clock >= 8. At a IP frequency of 48 MHz, the maximum bit rate is 6 Mbps.
- MEDIAN is '1' and external SPI master has "late MISO sample functionality": IP clock/IF clock >= 4. At a IP frequency of 48 MHz, the maximum bit rate is 12 Mbps.
The maximum bit rates provide an IP centric perspective, assuming ideal (0 ns) IO cell and routing (chip and board) delay. The required IP clock/IF clock ratio increases and the calculated maximum bit rate decreases, when realistic chip and routing delays are taken into account.

In UART standard submode (including LIN), the valid range is [7, 15]. In UART SmartCard submode, the valid range is [7, 15].

In UART TX IrDA submode this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. Only normal transmission mode is supported, the pulse is roughly 3/16 of the bit period (for all bit rates). There is only one valid OVS value:
- 0: 16 times oversampling.
 IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.

In UART RX IrDA submode (1.2, 2.4, 9.6, 19.2, 38.4, 57.6 and 115.2 Kbps) this field indirectly specifies the oversampling. The oversampling determines the interface clock/bit cycle and the width of the pulse. In normal transmission mode, this pulse is roughly 3/16 of the bit period (for all bit rates). In low power transmission mode, this pulse is potentially smaller (down to 1.62 us typical and 1.41 us minimal) than 3/16 of the bit period (for < 115.2 Kbps bitrates). Pulse widths greater or equal than two IP clock cycles are guaranteed to be detected by the receiver. Pulse widths less than two IP clock cycles and greater or equal than one IP clock cycle may be detected by the receiver. Pulse widths less than one IP clock cycle will not be detected by the receiver. RX_CTRL.MEDIAN should be set to '1' for IrDA receiver functionality. The IP clock (as provided by the programmable clock IP) and the oversampling together determine the IrDA bitrate. Normal mode, OVS field values (with the required IP clock frequency):
- 0: 16 times oversampling.
 IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
 IP clock frequency of 16*57.6 KHz for 57.6 Kbps.
 IP clock frequency of 16*38.4 KHz for 38.4 Kbps.
 IP clock frequency of 16*19.2 KHz for 19.2 Kbps.
 IP clock frequency of 16*9.6 KHz for 9.6 Kbps.
 IP clock frequency of 16*2.4 KHz for 2.4 Kbps.
 IP clock frequency of 16*1.2 KHz for 1.2 Kbps.
- all other values are not used in normal mode.
Low power mode, OVS field values (with the required IP clock frequency):
- 0: 16 times oversampling.
 IP clock frequency of 16*115.2 KHz for 115.2 Kbps.
- 1: 32 times oversampling.
 IP clock frequency of 32*57.6 KHz for 57.6 Kbps.
- 2: 48 times oversampling.
 IP clock frequency of 48*38.4 KHz for 38.4 Kbps.
- 3: 96 times oversampling.
 IP clock frequency of 96*19.2 KHz for 19.2 Kbps.
- 4: 192 times oversampling.
 IP clock frequency of 192*9.6 KHz for 9.6 Kbps.
- 5: 768 times oversampling.
 IP clock frequency of 768*2.4 KHz for 2.4 Kbps.
- 6: 1536 times oversampling.
 IP clock frequency of 1536*1.2 KHz for 1.2 Kbps.
- all other values are not used in low power mode.
Default Value: 15

0	EC_BUSY	Inidicates whether the externally clocked logic is potentially accessing the EZ memory (this is only possible in EZ mode). This bit can be used by SW to determine whether it is safe to issue a SW access to the EZ memory (without bus wait states (a blocked SW access) or bus errors being generated). Note that the INTR_TX.BLOCKED and INTR_RX.BLOCKED interrupt causes are used to indicate whether a SW access was actually blocked by externally clocked logic. Default Value: Undefined

31	MASTER_MODE	Master mode enabled ('1') or not ('0'). Note that both master and slave modes can be enabled at the same time. This allows the IP to address itself. Default Value: 0
30	SLAVE_MODE	Slave mode enabled ('1') or not ('0'). Default Value: 0
16	LOOPBACK	Local loopback control (does NOT affect the information on the pins). Only applicable in master/slave mode. When '0', the I2C SCL and SDA lines are connected to the I2C SCL and SDA pins. When '1', I2C SCL and SDA lines are routed internally in the peripheral, and as a result unaffected by other I2C devices. This allows a SCB I2C peripheral to address itself. Default Value: 0

6.1.3   **SCB_I2C_CTRL** (continued)

15	S_NOT_READY_-DATA_NACK	For internally clocked logic only. Only used when: - non EZ mode. Functionality is as follows: - 1: a received data element byte the slave is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). Default Value: 1
14	S_NOT_READY_ADDR_NACK	For internally clocked logic (EC_AM is '0' and EC_OP is '0') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when: - EC_AM is '0', EC_OP is '0' and non EZ mode. Functionality is as follows: - 1: a received (matching) slave address is immediately NACK'd when the receiver FIFO is full. - 0: clock stretching is performed (till the receiver FIFO is no longer full). For externally clocked logic (EC_AM is '1') on an address match or general call address (and S_GENERAL_IGNORE is '0'). Only used when (NOT used when EC_AM is '1' and EC_OP is '1' and address match and EZ mode): - EC_AM is '1' and EC_OP is '0'. - EC_AM is '1' and general call address match. - EC_AM is '1' and non EZ mode. Functionality is as follows: - 1: a received (matching or general) slave address is always immediately NACK'd. There are two possibilities: 1). the internally clocked logic is enabled (we are in Active system power mode) and it handles the rest of the current transfer. In this case the I2C master will not observe the NACK. 2). the internally clocked logic is not enabled (we are in DeepSleep system power mode). In this case the I2C master will observe the NACK and may retry the transfer in the future (which gives the internally clocked logic the time to wake up from DeepSleep system power mode). - 0: clock stretching is performed (till the internally clocked logic takes over). The internally clocked logic will handle the ongoing transfer as soon as it is enabled. Default Value: 1
13	S_READY_DATA_ACK	When '1', a received data element by the slave is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'. Default Value: 1
12	S_READY_ADDR_ACK	When '1', a received (matching) slave address is immediately ACK'd when the receiver FIFO is not full. In EZ mode, this field should be set to '1'. Default Value: 1
11	S_GENERAL_IGNORE	When '1', a received general call slave address is immediately NACK'd (no ACK or clock stretching) and treated as a non matching slave address. This is useful for slaves that do not need any data supplied within the general call structure. Default Value: 1
9	M_NOT_READY_-DATA_NACK	When '1', a received data element byte the master is immediately NACK'd when the receiver FIFO is full. When '0', clock stretching is used instead (till the receiver FIFO is no longer full). Default Value: 1
8	M_READY_DATA_ACK	When '1', a received data element by the master is immediately ACK'd when the receiver FIFO is not full. Default Value: 1

6.1.3 SCB_I2C_CTRL (continued)

7 : 4	LOW_PHASE_OVS	Serial I2C interface low phase oversampling factor. LOW_PHASE_OVS + 1 peripheral clock periods constitute the low phase of a bit period. The valid range is [7, 15] with input signal median filtering and [6, 15] without input signal median filtering. The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular (no stretching) interface (IF) low time to guarantee functional correct behavior. With input signal median filtering, the IF low time should be >= 8 IP clock cycles and <= 16 IP clock cycles. Without input signal median filtering, the IF low time should be >= 7 IP clock cycles and <= 16 IP clock cycles. Default Value: 8
3 : 0	HIGH_PHASE_OVS	Serial I2C interface high phase oversampling factor. HIGH_PHASE_OVS + 1 peripheral clock periods constitute the high phase of a bit period. The valid range is [5, 15] with input signal median filtering and [4, 15] without input signal median filtering. The field is only used in master mode. In slave mode, the field is NOT used. However, there is a frequency requirement for the IP clock wrt. the regular interface (IF) high time to guarantee functional correct behavior. With input signal median filtering, the IF high time should be >= 6 IP clock cycles and <= 16 IP clock cycles. Without input signal median filtering, the IF high time should be >= 5 IP clock cycles and <= 16 IP clock cycles. Default Value: 8

Bits	Name	Description
23 : 16	BASE_EZ_ADDR	I2C slave base EZ address. Address as provided by an I2C write transfer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable, as clock domain synchronization is not performed in the design. Default Value: Undefined
15 : 8	CURR_EZ_ADDR	I2C slave current EZ address. Current address pointer. This field is only reliable in internally clocked mode. In externally clocked mode the field may be unreliable (during an ongoing transfer when I2C_EC_BUSY is '1'), as clock domain synchronization is not performed in the design. Default Value: Undefined
5	M_READ	I2C master read transfer ('1') or I2C master write transfer ('0'). When the I2C master is inactive/idle or transmitting START, REPEATED START, STOP or an address, this field is '0". Default Value: 0
4	S_READ	I2C slave read transfer ('1') or I2C slave write transfer ('0'). When the I2C slave is inactive/idle or receiving START, REPEATED START, STOP or an address, this field is '0". Default Value: 0

6.1.4   SCB_I2C_STATUS (continued)

1	I2C_EC_BUSY	Inidicates whether the externally clocked logic is potentially accessing the EZ memory and/or up-dating BASE_ADDR or CURR_ADDR (this is only possible in EZ mode). This bit can be used by SW to determine whether BASE_ADDR and CURR_ADDR are reliable. Default Value: Undefined
0	BUS_BUSY	I2C bus is busy. The bus is considered busy ('1'), from the time a START is detected or from the time the SCL line is '0'. The bus is considered idle ('0'), from the time a STOP is detected. If the IP is disabled, BUS_BUSY is '0'. After enabling the IP, it takes time for the BUS_BUSY to detect a busy bus. This time is the maximum high time of the SCL line. For a 100 kHz interface frequency, this maximum high time may last roughly 5 us (half a bit period). For single master systems, BUS_BUSY does not have to be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START (no bus collisions). For multi-master systems, BUS_BUSY can be used to detect an idle bus before a master starts a transfer using I2C_M_CMD.M_START_ON_IDLE (to prevent bus collisions). Default Value: 0

4	M_STOP	When '1', attempt to transmit a STOP. When this action is performed, the hardware sets this field to '0'. I2C_M_CMD.M_START has a higher priority than this command: in situations where both a STOP and a REPEATED START could be transmitted, M_START takes precedence over M_STOP. Default Value: 0
3	M_NACK	When '1', attempt to transmit a negative acknowledgement (NACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0
2	M_ACK	When '1', attempt to transmit an acknowledgement (ACK). When this action is performed, the hardware sets this field to '0'. Default Value: 0

6.1.5   SCB_I2C_M_CMD (continued)

1   M_START_ON_IDLE   When '1', transmit a START as soon as the bus is idle (I2C_STATUS.BUS_BUSY is '0', note that
                                     BUSY has a default value of '0'). For bus idle detection the hardware relies on STOP detection.
                                     As a result, bus idle detection is only functional after at least one I2C bus transfer has been de-
                                     tected on the bus (default/reset value of BUSY is '0') . A START is only transmitted when the
                                     master state machine is in the default state. When this action is performed, the hardware sets
                                     this field to '0'.
                                     Default Value: 0

0   M_START   When '1', transmit a START or REPEATED START. Whether a START or REPEATED START
                                     is transmitted depends on the state of the master state machine. A START is only transmitted
                                     when the master state machine is in the default state. A REPEATED START is transmitted when
                                     the master state machine is not in the default state, but is working on an ongoing transaction.
                                     The REPEATED START can only be transmitted after a NACK or ACK has been received for a
                                     transmitted data element or after a NACK has been transmitted for a received data element.
                                     When this action is performed, the hardware sets this field to '0'.

If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0
3 : 0	TRIGGER_LEVEL	Trigger level. When the transmitter FIFO has less entries than the number of this field, a transmitter trigger event is generated. Default Value: 0

27 : 24	WR_PTR	FIFO write pointer: FIFO location at which a new data frame is written. Default Value: 0
19 : 16	RD_PTR	FIFO read pointer: FIFO location from which a data frame is read by the hardware. Default Value: 0
15	SR_VALID	Indicates whether the TX shift registers holds a valid data frame ('1') or not ('0'). The shift register can be considered the top of the TX FIFO (the data frame is not included in the USED field of the TX FIFO). The shift register is a working register and holds the data frame that is currently transmitted (when the protocol state machine is transmitting a data frame) or the data frame that is tranmitted next (when the protocol state machine is not transmitting a data frame). Default Value: 0
4 : 0	USED	Amount of enties in the transmitter FIFO. The value of this field ranges from 0 to FF_DATA_NR. Default Value: 0

9	MEDIAN	Median filter. When '1', a digital 3 taps median filter is performed on input interface lines. This filter should reduce the susceptability to errors. However, its requires higher oversampling values. For UART IrDA submode, this field should always be '1'. Default Value: 0
8	MSB_FIRST	Least significant bit first ('0') or most significant bit first ('1'). For I2C, this field should be '1'. Default Value: 1
3 : 0	DATA_WIDTH	Dataframe width. DATA_WIDTH + 1 is the expected amount of bits in received data frame. This number does not include start, parity and stop bits. For UART mode, the valid range is [3, 8]. For SPI, the valid range is [3, 15]. For I2C the only valid value is 7. In EZ mode (for both SPI and I2C), the only valid value is 7. Default Value: 7

16	CLEAR	When '1', the receiver FIFO and receiver shift register are cleared/invalidated. Invalidation will last for as long as this field is '1'. If a quick clear/invalidation is required, the field should be set to '1' and be followed by a set to '0'. If a clear/invalidation is required for an extended time period, the field should be set to '1' during the complete time period. Default Value: 0

23 : 16	MASK	Slave device address mask. This field is a mask that specifies which of the ADDR field bits in the ADDR field take part in the matching of the slave address: MATCH = ((ADDR & MASK) == ("slave address" & MASK)). Default Value: 0
7 : 0	ADDR	Slave device address. In UART multi-processor mode, all 8 bits are used. In I2C slave mode, only bits 7 down to 1 are used. This reflects the organization of the first transmitted byte in a I2C transfer: the first 7 bits represent the address of the addressed slave, and the last 1 bit is a read/write indicator ('0': write, '1': read). 15 : 0	DATA	Data read from the receiver FIFO. Reading a data frame will remove the data frame from the FIFO; i.e. behavior is similar to that of a POP operation. Note that when CTRL.BYTE_MODE is '1', only DATA[7:0] are used. This register has a side effect when read by software: a data frame is removed from the FIFO. This may be undesirable during debug; i.e. a read during debug should NOT have a side effect. To this end, the IP uses the AHB-Lite "hmaster[0]" input signal. When this signal is '1' in the address cycle of a bus transfer, a read transfer will not have a side effect. As a result, a read from this register will not remove a data frame from the FIFO. As a result, a read from this register behaves as a read from the SCB_RX_FIFO_RD_SILENT register. A read from an empty RX FIFO sets INTR_RX.UNDERFLOW to '1'. Default Value: Undefined

Only available for a slave request with an address match, in EZ and CMD_RESP modes, when EC_OP is '1'. Default Value: 0
2	EZ_WRITE_STOP	STOP detection after a write transfer occurred. Activated on the end of a write transfer (I2C STOP). This event is an indication that a buffer memory location has been written to. For EZ mode: a transfer that only writes the base address does NOT activate this event. Only available for a slave request with an address match, in EZ and CMD_RESP modes, when EC_OP is '1'. Default Value: 0

Bits	Name	Description
8	I2C_BUS_ERROR	I2C slave bus error (unexpected detection of START or STOP condition). This should not occur, it represents erroneous I2C bus behavior. In case of a bus error, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. Default Value: 0
7	I2C_GENERAL	I2C slave general call address received. If CTRL.ADDR_ACCEPT, the received address 0x00 (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected. Default Value: 0
6	I2C_ADDR_MATCH	I2C slave matching address received. If CTRL.ADDR_ACCEPT, the received address (including the R/W bit) is available in the RX FIFO. In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') and internally clocked operation (CTRL.EC_OP_MODE is '0'), this field is set when the event is detected. Default Value: 0

6.1.27 SCB_INTR_S (continued)

| 5 | I2C_START | I2C slave START received. Set to '1', when START or REPEATED START event is detected. |

In the case of externally clocked address matching (CTRL.EC_AM_MODE is '1') AND clock stretching is performed (till the internally clocked logic takes over) (I2C_CTRL.S_NOT_READY_ADDR_NACK is '0'), this field is NOT set. The Firmware should use INTR_S_EC.WAKE_UP, INTR_S.I2C_ADDR_MATCH and INTR_S.I2C_GENERAL.
Default Value: 0

| 4 | I2C_STOP | I2C STOP event for I2C (read or write) transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address. |

The event is detected on any I2C transfer intended for this slave. Note that a I2C address intended for the slave (address is matching) will result in a I2C_STOP event independent of whether the I2C address is ACK'd or NACK'd.
Default Value: 0

| 3 | I2C_WRITE_STOP | I2C STOP event for I2C write transfer intended for this slave (address matching is performed). Set to '1', when STOP or REPEATED START event is detected. The REPEATED START event is included in this interrupt cause such that the I2C transfers separated by a REPEATED START can be distinguished and potentially treated separately by the Firmware. Note that the second I2C transfer (after a REPEATED START) may be to a different slave address. |

In non EZ mode, the event is detected on any I2C write transfer intended for this slave. Note that a I2C write address intended for the slave (address is matching and a it is a write transfer) will result in a I2C_WRITE_STOP event independent of whether the I2C address is ACK'd or NACK'd.

In EZ mode, the event is detected only on I2C write transfers that have EZ data written to the memory structure (an I2C write transfer that only communicates an I2C address and EZ address, will not result in this event being detected).
Default Value: 0

| 2 | I2C_ACK | I2C slave acknowledgement received. Set to '1', when the slave receives a ACK (typically after the slave transmitted TX data). |
Default Value: 0

| 1 | I2C_NACK | I2C slave negative acknowledgement received. Set to '1', when the slave receives a NACK (typically after the slave transmitted TX data). |
Default Value: 0

| 0 | I2C_ARB_LOST | I2C slave lost arbitration: the value driven on the SDA line is not the same as the value observed on the SDA line (while the SCL line is '1'). This should not occur, it represents erroneous I2C bus behavior. In case of lost arbitration, the I2C slave state machine abort the ongoing transfer. The Firmware may decide to clear the TX and RX FIFOs in case of this error. |
Default Value: 0

Name	OFFSET [7:0]							

Bits	Name	Description
7 : 0	OFFSET	Frequency trim bits. These bits are determined at manufacturing time for each FREQ setting (IMO_TRIM2) and stored in SFLASH. Default Value: X

8 SPCIF Registers

This section discusses the SPCIF registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

8.1 SPCIF Register Mapping Details

Register	Address	Description
SPCIF_GEOMETRY	0x40110000	Flash/NVL geometry information
SPCIF_INTR	0x401107F0	SPCIF interrupt request register
SPCIF_INTR_SET	0x401107F4	SPCIF interrupt set request register
SPCIF_INTR_MASK	0x401107F8	SPCIF interrupt mask register
SPCIF_INTR_MASKED	0x401107FC	SPCIF interrupt masked request register

Bits	31	30	29	28	27	26	25	24
SW Access	RW	None						
HW Access		None						
Name	DE_CP-D_LP	None [30:24]						

Bits	Name	Description
31	DE_CPD_LP	0': SRAM busy wait loop has not been copied. '1': Busy wait loop has been written into SRAM. Default Value: 0
23 : 22	FLASH_ROW	Page size in 64 Byte multiples (chip dependent): "0": 64 byte "1": 128 byte "2": 192 byte "3": 256 byte The page size is used to detemine the number of Bytes in a page for Flash page based operations (e.g. PGM_PAGE). Note: the field name FLASH_ROW is misleading, as this field specifies the number of Bytes in a page, rather than the number of Bytes in a row. In a single plane flash macro architecture, a page consists of a single row. However, in a multi plane flash macro architecture, a page consists of multiple rows from different planes. Default Value: Undefined

8.1.1 SPCIF_GEOMETRY (continued)

21 : 20	NUM_FLASH	Number of flash macros (chip dependent): "0": 1 flash macro "1": 2 flash macros "2": 3 flash macros "3": 4 flash macros Default Value: Undefined
19 : 16	SFLASH	Supervisory flash capacity in 256 Byte multiples (chip dependent). If multiple flash macros are present, this field provides the supervisory flash capacity of all flash macros together: "0": 256 Bytes. "1": 2*256 Bytes. ... "15": 16*256 Bytes. Default Value: Undefined
15 : 0	FLASH	Regular flash capacity in 256 Byte multiples (chip dependent). If multiple flash macros are present, this field provides the flash capacity of all flash macros together: "0": 256 Bytes. "1": 2*256 Bytes. ... "65535": 65536*256 Bytes. Default Value: Undefined

9 SRSSLT Registers

This section discusses the SRSSLT registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

9.1 SRSSLT Register Mapping Details

Register	Address	Description
PWR_CONTROL	0x40030000	Power Mode Control
PWR_KEY_DELAY	0x40030004	Power System Key&Delay Register
PWR_DDFT_SELECT	0x4003000C	Power DDFT Mode Selection Register

HW Access	A	None			RW		R	R
Name	EXT_VCCD	None [22:20]			SPARE [19:18]		OVER_-TEMP_-THRESH	OVER_-TEMP_EN

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
23	EXT_VCCD	Always write 0 except as noted below. PSoC4-S0 and MBR3 CapSense products may set this bit if Vccd is provided externally (on Vccd pin). Setting this bit turns off the active regulator and will lead to system reset (BOD) unless both Vddd and Vccd pins are supplied externally. This register bit only resets for XRES, POR, or a detected BOD. Default Value: 0
19 : 18	SPARE	Spare AHB readback bits that are hooked to PWR_PWRSYS_TRIM1.SPARE_TRIM[1:0] through spare logic equivalent to bitwise inversion. Engineering only. Default Value: 0
17	OVER_TEMP_THRESH	Over-temperature threshold. 0: TEMP_HIGH condition occurs between 120C and 125C. 1: TEMP_HIGH condition occurs between 60C and 75C (used for testing). Default Value: 0
16	OVER_TEMP_EN	Enables the die over temperature sensor. Must be enabled when using the TEMP_HIGH interrupt. Default Value: 0

9.1.1   PWR_CONTROL (continued)

5	LPM_READY	Indicates whether the low power mode regulator is ready to enter DEEPSLEEP mode.

5   LPM_READY   Indicates whether the low power mode regulator is ready to enter DEEPSLEEP mode.
0: If DEEPSLEEP mode is requested, device will enter SLEEP mode. When low power regulators are ready, device will automatically enter the originally requested mode.
1: Normal operation. DEEPSLEEP works as described.
Default Value: 0

4   DEBUG_SESSION   Indicates whether a debug session is active (CDBGPWRUPREQ signal is 1)
Default Value: 0

0x0: NO_SESSION :
No debug session active

0x1: SESSION_ACTIVE :
Debug session is active

3 : 0   POWER_MODE   Current power mode of the device. Note that this field cannot be read in all power modes on actual silicon.
Default Value: 0

0x0: RESET :
RESET state

0x1: ACTIVE :
ACTIVE state

0x2: SLEEP :
SLEEP state

0x3: DEEP_SLEEP :
DEEP_SLEEP state

9.1.2   PWR_KEY_DELAY

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
9 : 0	WAKEUP_HOLDOFF	Delay to wait for references to settle on wakeup from deepsleep. BOD is ignored and system does not resume until this delay expires. Note that the same delay on POR is hard-coded. The default assumes the output of the predivider is 48MHz + 3%. Firmware may scale this setting according to the fastest actual clock frequency that can occur when waking from DEEPSLEEP. Default Value: 248

9.1.3   PWR_DDFT_SELECT

Bits	Name	Description
31	TEST_MODE	0: Normal operation mode 1: Test mode (any test mode) Setting this bit will prevent BootROM from yielding execution to Flash image. Default Value: 0
30	TEST_KEY_DFT_EN	This bit is set when a XRES test mode key is shifted in. It is the value of the test_key_dft_en signal. When this bit is set, the BootROM will not yield execution to the FLASH image (same function as setting TEST_MODE bit below). Default Value: 0
28	BLOCK_ALT_XRES	Relevant only for parts that have the alternate XRES mechanism of overloading a GPIO pin temporarily as alternate XRES during test. When set, this bit blocks the alternate XRES function, such that the pin can be used for normal I/O or for ddft/adft observation. This register bit only resets for XRES, POR, or a detected BOD. Default Value: 0

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	IGNORE_BITS	The number of MSB bits of the watchdog timer that are NOT checked against MATCH. This value provides control over the time-to-reset of the watchdog (which happens after 3 successive matches). Note that certain products may enforce a minimum value for this register through design time configuration. Default Value: 0
15 : 0	MATCH	Match value for Watchdog counter. Every time WDT_COUNTER reaches MATCH an interrupt is generated. Two unserviced interrupts will lead to a system reset (i.e. at the third match). Default Value: 4096

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
1	TEMP_HIGH	Regulator over-temp interrupt. This interrupt can occur when a short circuit exists on the vccd pin or when extreme loads are applied on IO-cells causing the die to overheat. Firmware is encourage to shutdown all IO cells and then go to DeepSleep mode when this interrupt occurs if protection against such conditions is desired. Default Value: 0
0	WDT_MATCH	WDT Interrupt Request. This bit is set each time WDT_COUNTR==WDT_MATCH. Clearing this bit also feeds the watch dog. Missing 2 interrupts in a row will generate brown-out reset. Due to internal synchronization, it takes 2 SYSCLK cycles to update after a W1C. Default Value: 0

4 : 0	STEPSIZE	IMO trim stepsize bits. These bits are determined at manufacturing time to adjust for process variation. They are used to tune the stepsize of the FSOFFSET and OFFSET trims. Default Value: 16

10   TCPWM Registers

This section discusses the TCPWM registers of PSoC 4 device. It lists all the registers in mapping tables, in address order.

10.1   TCPWM Register Mapping Details

Register	Address	Description
TCPWM_CTRL	0x40050000	TCPWM control register 0.
TCPWM_CMD	0x40050008	TCPWM command register.
TCPWM_INTR_CAUSE	0x4005000C	TCPWM Counter interrupt cause register.
TCPWM_CNT0_CTRL	0x40050100	Counter control register
TCPWM_CNT0_STATUS	0x40050104	Counter status register
TCPWM_CNT0_COUNTER	0x40050108	Counter count register
TCPWM_CNT0_CC	0x4005010C	Counter compare/capture register
TCPWM_CNT0_CC_BUFF	0x40050110	Counter buffered compare/capture register
TCPWM_CNT0_PERIOD	0x40050114	Counter period register
TCPWM_CNT0_PERIOD_BUFF	0x40050118	Counter buffered period register
TCPWM_CNT0_TR_CTRL0	0x40050120	Counter trigger control register 0
TCPWM_CNT0_TR_CTRL1	0x40050124	Counter trigger control register 1
TCPWM_CNT0_TR_CTRL2	0x40050128	Counter trigger control register 2
TCPWM_CNT0_INTR	0x40050130	Interrupt request register.
TCPWM_CNT0_INTR_SET	0x40050134	Interrupt set request register.
TCPWM_CNT0_INTR_MASK	0x40050138	Interrupt mask register.
TCPWM_CNT0_INTR_MASKED	0x4005013C	Interrupt masked request register

10.1.1   TCPWM_CTRL

Bits	31	30	29	28	27	26	25	24
SW Access	None							
HW Access	None							
Name	None [31:24]							

Bits	Name	Description
0	COUNTER_ENABLED	Counter enables for counters 0 up to CNT_NR-1. '0': counter disabled. '1': counter enabled. Counter static configuration information (e.g. CTRL.MODE, all TR_CTRL0, TR_CTRL1, and TR_CTRL2 register fields) should only be modified when the counter is disabled. When a counter is disabled, command and status information associated to the counter is cleared by HW, this includes: - the associated counter triggers in the CMD register are set to '0'. - the counter's interrupt cause fields in counter's INTR register. - the counter's status fields in counter's STATUS register.. - the counter's trigger outputs ("tr_overflow", "tr_underflow" and "tr_compare_match"). - the counter's line outputs ("line_out" and "line_compl_out"). Default Value: 0

10.1.2   TCPWM_CMD

Bits	31	30	29	28	27	26	25	24
SW Access	None							RW1S
HW Access	None							RW1C
Name	None [31:25]							COUNTER_START

Bits	Name	Description
24	COUNTER_START	Counters SW start trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
16	COUNTER_STOP	Counters SW stop trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
8	COUNTER_RELOAD	Counters SW reload trigger. For HW behavior, see COUNTER_CAPTURE field. Default Value: 0
0	COUNTER_CAPTURE	Counters SW capture trigger. When written with '1', a capture trigger is generated and the HW sets the field to '0' when the SW trigger has taken effect. It should be noted that the HW operates on the counter frequency. If the counter is disabled through CTRL.COUNTER_ENABLED, the field is immediately set to '0'. Default Value: 0

10.1.3 TCPWM_INTR_CAUSE

SW Access	None					RW		
HW Access	None					R		
Name	None [31:27]					MODE [26:24]		

Bits	Name	Description
26 : 24	MODE	Counter mode. Default Value: 0 **0x0: TIMER :** Timer mode **0x2: CAPTURE :** Capture mode **0x3: QUAD :** Quadrature encoding mode

10.1.4   **TCPWM_CNT0_CTRL** (continued)

0x4: PWM :

Pulse width modulation (PWM) mode

0x5: PWM_DT :

PWM with deadtime insertion mode

0x6: PWM_PR :

Pseudo random pulse width modulation

21 : 20	QUADRATURE_MODE	In QUAD mode selects quadrature encoding mode (X1/X2/X4). In PWM, PWM_DT and PWM_PR modes, these two bits can be used to invert "dt_line_out" and "dt_line_compl_out". Inversion is the last step in generation of "dt_line_out" and "dt_line_com-pl_out"; i.e. a disabled output line "dt_line_out" has the value QUADRATURE_MODE[0] and a disabled output line "dt_line_compl_out" has the value QUADRATURE_MODE[1]. Default Value: 0

0x0: X1 :

X1 encoding (QUAD mode)

0x1: X2 :

X2 encoding (QUAD mode)

0x2: X4 :

X4 encoding (QUAD mode)

0x1: INV_OUT :

When bit 0 is '1', QUADRATURE_MODE[0] inverts "dt_line_out" (PWM/PWM_DT modes)

0x2: INV_COMPL_OUT :

When bit 1 is '1', QUADRATURE_MODE[1] inverts "dt_line_compl_out" (PWM/PWM_DT modes)

18	ONE_SHOT	When '0', counter runs continuous. When '1', counter is turned off by hardware when a terminal count event is generated. Default Value: 0
17 : 16	UP_DOWN_MODE	Determines counter direction. Default Value: 0

0x0: COUNT_UP :

Count up (to PERIOD). An overflow event is generated when the counter reaches PERIOD. A terminal count event is generated when the counter reaches PERIOD.

10.1.4   **TCPWM_CNT0_CTRL** (continued)

0x1: COUNT_DOWN :

Count down (to "0"). An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".

0x2: COUNT_UPDN1 :

Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0".

0x3: COUNT_UPDN2 :

Count up (to PERIOD), then count down (to "0"). An overflow event is generated when the counter reaches PERIOD. An underflow event is generated when the counter reaches "0". A terminal count event is generated when the counter reaches "0" AND when the counter reaches PERIOD (this counter direction can be used for PWM functionality with asymmetrical updates).

15 : 8	GENERIC	Generic 8-bit control field. In PWM_DT mode, this field is used to determine the dead time: amount of dead time cycles in the counter clock domain. In all other modes, the lower 3 bits of this field determine pre-scaling of the selected counter clock. Default Value: 0

0x0: DIVBY1 :

Divide by 1 (other-than-PWM_DT mode)

0x1: DIVBY2 :

Divide by 2 (other-than-PWM_DT mode)

0x2: DIVBY4 :

Divide by 4 (other-than-PWM_DT mode)

0x3: DIVBY8 :

Divide by 8 (other-than-PWM_DT mode)

0x4: DIVBY16 :

Divide by 16 (other-than-PWM_DT mode)

0x5: DIVBY32 :

Divide by 32 (other-than-PWM_DT mode)

0x6: DIVBY64 :

Divide by 64 (other-than-PWM_DT mode)

10.1.4 **TCPWM_CNT0_CTRL** (continued)

0x7: DIVBY128 :

Divide by 128 (other-than-PWM_DT mode)

3	PWM_STOP_ON_KILL	Specifies whether the counter stops on a kill events: '0': kill event does NOT stop counter. '1': kill event stops counter. This field has a function in PWM, PWM_DT and PWM_PR modes only. Default Value: 0
2	PWM_SYNC_KILL	Specifies asynchronous/synchronous kill behavior: '1': synchronous kill mode: the kill event disables the "dt_line_out" and "dt_line_compl_out" signals till the next terminal count event (synchronous kill). In synchronous kill mode, STOP_EDGE should be RISING_EDGE. '0': asynchronous kill mode: the kill event only disables the "dt_line_out" and "dt_line_compl_out" signals when present. In asynchronous kill mode, STOP_EDGE should be NO_EDGE_DET. This field has a function in PWM and PWM_DT modes only. This field is only used when PWM_STOP_ON_KILL is '0'. Default Value: 0
1	AUTO_RELOAD_PERIOD	Specifies switching of the PERIOD and buffered PERIOD values. This field has a function in PWM, PWM_DT and PWM_PR modes. '0': never switch. '1': switch on a terminal count event with and actively pending siwtch event. Default Value: 0
0	AUTO_RELOAD_CC	Specifies switching of the CC and buffered CC values. This field has a function in TIMER, PWM, PWM_DT and PWM_PR modes. Timer mode: '0': never switch. '1': switch on a compare match event. PWM, PWM_DT, PWM_PR modes: '0: never switch. '1': switch on a terminal count event with an actively pending switch event. Default Value: 0

HW Access	None							
Name	None [31:24]							

Bits	Name	Description
19 : 16	START_SEL	Selects one of the 16 input triggers as a start trigger. In QUAD mode, this is the second phase (phi B). Default Value: 0
15 : 12	STOP_SEL	Selects one of the 16 input triggers as a stop trigger. In PWM, PWM_DT and PWM_PR modes, this is the kill trigger. In these modes, the kill trigger is used to either temporarily block the PWM outputs (PWM_STOP_ON_KILL is '0') or stop the functionality (PWM_STOP_ON_KILL is '1'). For the PWM and PWM_DT modes, the blocking of the output signals can be asynchronous (STOP_EDGE should be NO_EDGE_DET) in which case the blocking is as long as the trigger is '1' or synchronous (STOP_EDGE should be RISING_EDGE) in which case it extends till the next terminal count event. Default Value: 0
11 : 8	RELOAD_SEL	Selects one of the 16 input triggers as a reload trigger. In QUAD mode, this is the index or revolution pulse. In this mode, it will update the counter with the value in the TCPWM_CNTn_PERIOD register. Default Value: 0
7 : 4	COUNT_SEL	Selects one of the 16 input triggers as a count trigger. In QUAD mode, this is the first phase (phi A). Default setting selects input trigger 1, which is always '1'. Default Value: 1

10.1.11   **TCPWM_CNT0_TR_CTRL0** (continued)

| 3 : 0 | CAPTURE_SEL | Selects one of the 16 input triggers as a capture trigger. Input trigger 0 is always '0' and input trigger is always '1'. In the PWM, PWM_DT and PWM_PR modes this trigger is used to switch the values if the compare and period registers with their buffer counterparts.
Default Value: 0 |

5 : 4	RELOAD_EDGE	A reload event will initialize the counter. When counting up, the counter is initialized to "0". When counting down, the counter is initialized with PERIOD. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event. **0x1: FALLING_EDGE :** Falling edge. Any falling edge generates an event. **0x2: BOTH_EDGES :** Rising AND falling edge. Any odd amount of edges generates an event. **0x3: NO_EDGE_DET :** No edge detection, use trigger as is.
3 : 2	COUNT_EDGE	A counter event will increase or decrease the counter by '1'. Default Value: 3 **0x0: RISING_EDGE :** Rising edge. Any rising edge generates an event.

10.1.12   **TCPWM_CNT0_TR_CTRL1** (continued)

0x1: FALLING_EDGE :

Falling edge. Any falling edge generates an event.

0x2: BOTH_EDGES :

Rising AND falling edge. Any odd amount of edges generates an event.

0x3: NO_EDGE_DET :

No edge detection, use trigger as is.

1 : 0	CAPTURE_EDGE	A capture event will copy the counter value into the CC register. Default Value: 3

0x0: RISING_EDGE :

Rising edge. Any rising edge generates an event.

0x1: FALLING_EDGE :

Falling edge. Any falling edge generates an event.

0x2: BOTH_EDGES :

Rising AND falling edge. Any odd amount of edges generates an event.

0x3: NO_EDGE_DET :

No edge detection, use trigger as is.

11   ROM Table Registers

This section discusses the ROM Table registers. It lists all the registers in mapping tables, in address order.

11.1   Register Details

Register	Address	Description
ROMTABLE_ADDR	0xF0000000	Link to Cortex M0 ROM Table.
ROMTABLE_DID	0xF0000FCC	Device Type Identifier register.
ROMTABLE_PID4	0xF0000FD0	Peripheral Identification Register 4.
ROMTABLE_PID5	0xF0000FD4	Peripheral Identification Register 5.
ROMTABLE_PID6	0xF0000FD8	Peripheral Identification Register 6.
ROMTABLE_PID7	0xF0000FDC	Peripheral Identification Register 7.
ROMTABLE_PID0	0xF0000FE0	Peripheral Identification Register 0.
ROMTABLE_PID1	0xF0000FE4	Peripheral Identification Register 1.
ROMTABLE_PID2	0xF0000FE8	Peripheral Identification Register 2.
ROMTABLE_PID3	0xF0000FEC	Peripheral Identification Register 3.
ROMTABLE_CID0	0xF0000FF0	Component Identification Register 0.
ROMTABLE_CID1	0xF0000FF4	Component Identification Register 1.
ROMTABLE_CID2	0xF0000FF8	Component Identification Register 2.
ROMTABLE_CID3	0xF0000FFC	Component Identification Register 3.
